

Infrastructure as Code and DevOps for Network Engineers

1

Abstract

Many organisations are trying to be more agile in their application delivery and are looking to practices such as “DevOps” and “Infrastructure as Code” to achieve this. But how does the network fit into these new models?

This session will introduce the concepts of DevOps and Infrastructure as Code, as well as the commonly used toolsets. The session will cover examples of how these tools can be used together to create rapid application delivery workflows, and practical use cases in managing a network. Finally, we will cover how these techniques can be applied to the network infrastructure, either on a device-by-device basis, on a network systems basis, or to the entire infrastructure with private cloud management platforms.

1

2

Infrastructure as Code

Configuration Management

3

Configuration Management

- Today
 - Canonical configuration on individual devices
 - Many touch points for configuration changes
 - Difficult rollback
- Configuration Management
 - Centrally define desired state/configuration of all devices or subsets of devices

2

4

Declarative vs Imperative

Puppet (declarative)

```
user { 'cgascoig' :
  ensure => present,
  gid => 'admin',
}

group { 'admin' :
  ensure => present,
}
```

Shell script (imperative)

```
#!/bin/bash

if ! getent group sysadmin >/dev/null
then
    echo "Group sysadmin does not exist, creating"
    groupadd sysadmin
fi

if ! getent passwd chris >/dev/null
then
    echo "User chris does not exist, creating"
    useradd --gid sysadmin chris
fi

USERGROUPID=$(getent passwd chris | awk-F: '{print $4}')
USERGROUPNAME=$(getent group $USERGROUPID | awk-F: '{print $1}')

if [ "$USERGROUPNAME" != "sysadmin" ]
then
    echo "Primary group of user chris is not
sysadmin, updating"
    usermod --gid sysadmin chris
fi
```

4

8

What is Puppet?

- Next-generation server automation tool
- Declarative language for expressing system configuration
- Client and server for distributing configuration
- Library for realising the configuration.

9

What is Chef?

- Configuration management tool written in Ruby and Erlang
- Pure-Ruby, domain-specific language (DSL) for writing system configuration "recipes"
- Streamlines the task of configuring & maintaining a company's servers
- Integrates with cloud-based platforms such as Rackspace and Amazon EC2 to automatically provision and configure new machines.

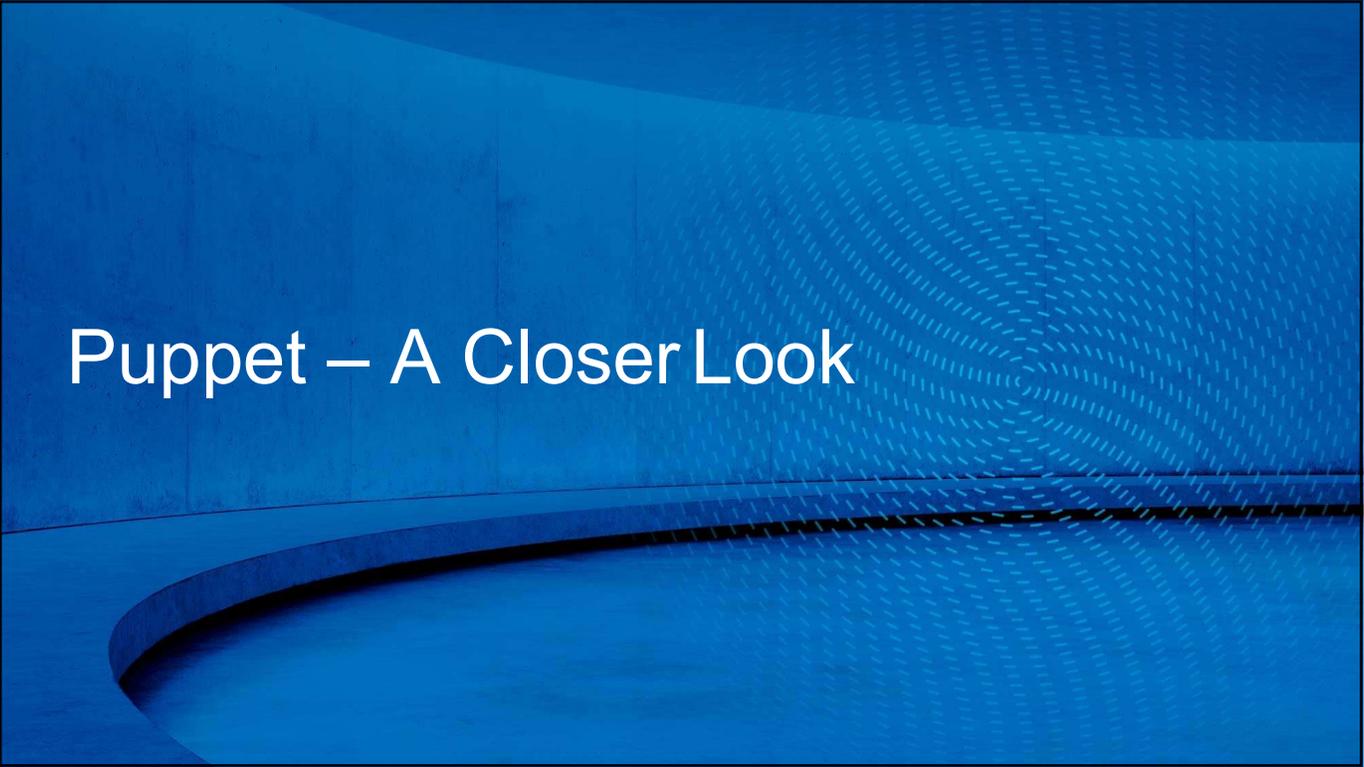

5

10

What is Ansible?

- IT automation engine for:
 - cloud provisioning
 - configuration management
 - application deployment
 - intra-service orchestration
- No agents or additional custom security infrastructure
- Very simple language

11

Puppet – A Closer Look

6

12

Puppet Workflow

1. DEFINE USING DECLARATIVE LANGUAGE

```
package { ssh: ensure => installed }
service { sshd: ensure => running, }
```

*Re-usable infrastructure-as-code
Define Desired State of Nodes*

2. SIMULATE DEPLOYMENT

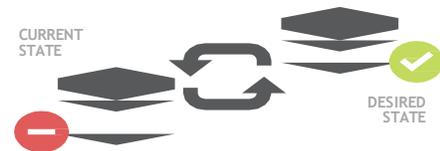

*Before deploying changes, put node
into simulation state*

4. REPORT

Insight into changes

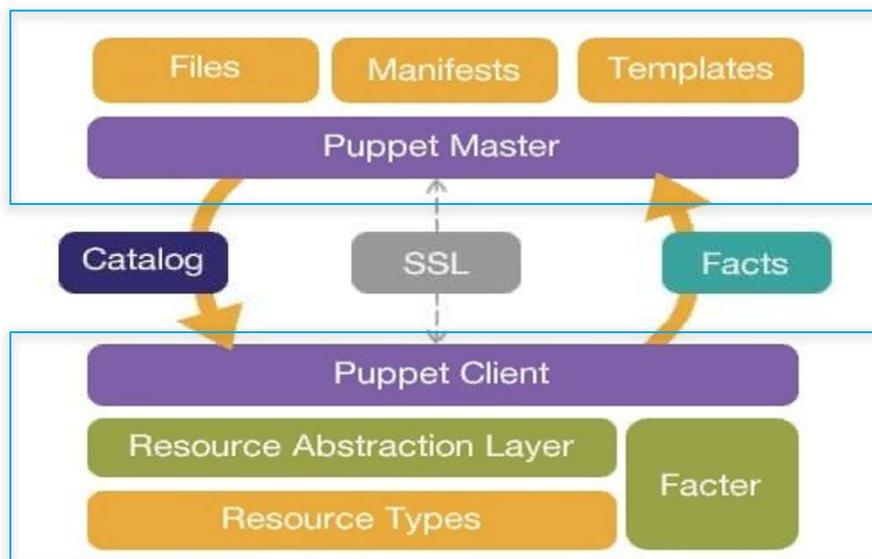

3. ENFORCE SYSTEM TO DESIRED STATE

Automatically and reliably

13

Puppet Architecture

7

14

Puppet Pieces (Terminology)

- Puppet Master
 - Central “controller” software which orchestrates configuration deployment for one or more agents. Configuration expressed as a “manifest”.
- Puppet Agent
 - Software which interacts with a single Puppet Master to obtain configuration (desired state) in terms of Puppet Resources. Uses Puppet Resource Providers to carry out tasks to achieve configuration (desired state).
- Puppet Resources
 - Term used for grouping of managed objects/attributes and one or more corresponding implementations of management tasks. The 2 layers of a resource:
 - Resource Type: Definition of managed objects.
 - Resource Provider: Implementation of management tasks on objects.
- Puppet Manifest
 - Collection of configuration settings in terms of resource type instances. Often referred to in puppet world as “code”. Manifests are commonly organised in sections that are mostly generic for many nodes (sections apply to specific types of nodes) using conditional logic.
- Facter
 - Software which discovers runtime state on an agent node
- Facter Facts
 - Runtime state for an agent node. Values can be strings, values, and arrays.
 - Facts used as variables in most puppet contexts, ie. in puppet master manifests, resource types, and resource providers.

15

Manifest Sample

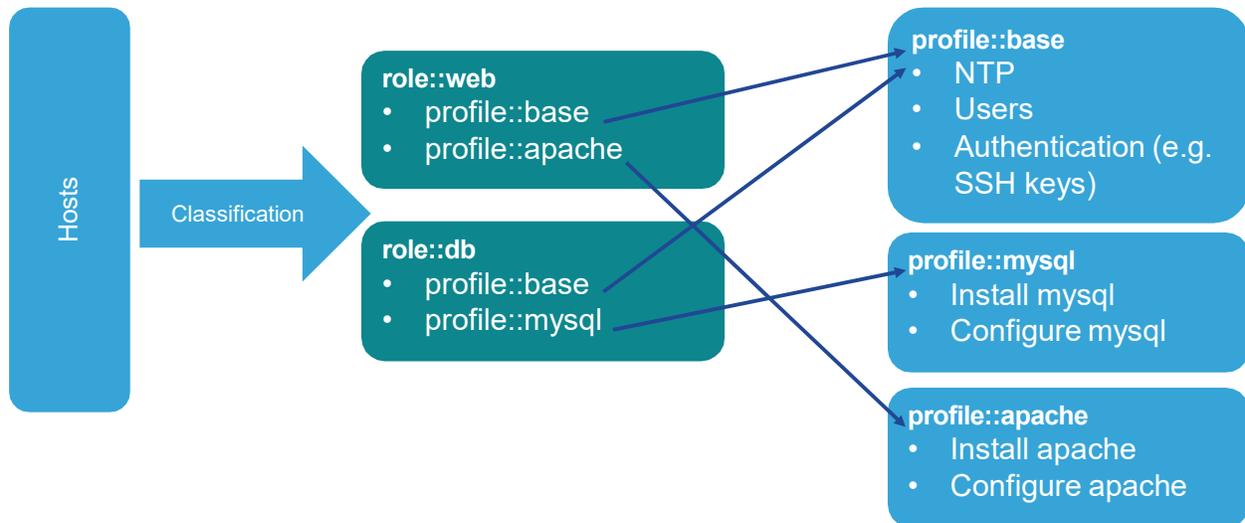

```
class ciscopuppet::demo_ntp {
  ntp_config { 'default':
    source_interface => 'ethernet2/1',
  }

  ntp_server { '5.5.5.5':
    ensure => present,
  }
}
```

8

16

Roles and Profiles Pattern

17

Puppet Run Modes

- Oneshot mode
 - Single run of puppet agent to request configuration from puppet master and take action to put resources in desired state.
- No-op mode
 - Single run of puppet agent to request configuration from puppet master BUT DO NOT take action on resources.
 - Used in scenarios where puppet master user wants to validate/inspect the catalogue being compiled for a node and understand the delta with current state.
- Daemon mode
 - Recurring periodic runs of puppet agent requesting configuration from puppet master and take action to put resources in desired state.

9

18

Puppet Enterprise Console

The screenshot displays the Puppet Enterprise Console interface. At the top, there are navigation tabs for Events, Nodes, Groups, Classes, Reports, Inventory Search, and Live Management. The main content area is divided into several sections:

- Background Tasks:** Shows a task for 'All systems go'.
- Nodes:** A summary section showing 5 Unresponsive, 0 Failed, 0 Pending, 1 Changed, 3 Unchanged, and 0 Unreported nodes. It includes an 'Add node' button and a 'Radiator View' link.
- Groups:** A list of groups including default, mcollecrive, no mcollecrive, puppet_console, puppet_master, puppet_puppetdb, and an 'Add group' button.
- Classes:** A list of classes including cisco_onep, cisco_onep:command, cisco_onep:command_comp, cisco_onep:conditional, cisco_onep:device, cisco_onep:interface_name, and cisco_onep:interface_yaml.
- Daily run status:** A bar chart showing the number and status of runs during the last 30 days. The legend indicates Failed (red), Pending (orange), Unchanged (green), and Changed (blue).
- Nodes Table:** A table listing nodes and their resources. The table has columns for Node, Latest report, Resources (Total, Failed, Pending, Changed, Unchanged).

Node	Latest report	Total	Failed	Pending	Changed	Unchanged
Total		378	0	0	11	367
n7k-core-2	2014-08-21 22:27 UTC	10	0	0	0	10
pmaster	2014-08-21 18:24 UTC	194	0	0	0	194
agent-213	2014-08-21 18:02 UTC	84	0	0	0	84
n7k-fabrimac	2014-08-21 17:35 UTC	10	0	0	1	9
puppet1	2014-08-18 20:29 UTC	16	0	0	2	14
n3k	2014-06-18 16:08 UTC	16	0	0	2	14
puppet-20	2014-04-30 21:29 UTC	16	0	0	2	14
puppet2	2014-04-16 19:06 UTC	16	0	0	2	14
puppetn3k	2014-03-20 05:22 UTC	16	0	0	2	14

Cisco and Puppet

The screenshot shows the Puppet Forge page for the `puppetlabs/ciscopuppet` module. The page includes a search bar, the module name, and compatibility information. The latest version is 1.1.0, released on Nov 11th 2015. The page also provides a command to install the module and a link to the README.

Latest version is compatible with:

- Puppet Enterprise 2015.3.x
- Puppet 4.x
- NX-OS

Tags: network, cisco, nxos, nx-os

Use this command to install the latest compatible version:

```
puppet module install puppetlabs-ciscopuppet
```

2,592 Latest version: 453

Version 1.1.0 released Nov 11th 2015

Cisco APIC Puppet Module

Overview

This module enables configuration of the Cisco ACI fabric via the Puppet configuration management system. By converting puppet manifests into APIC northbound REST API calls, this module can configure any features available via the APIC GUI, to achieve the desired end state.

Dependencies

This module depends on the acirb ruby GEM, which is included in the gems directory, but is also available from <http://github.com/datacenter/acirb>. You will first need to install the ACIRb gem, using: `gem install acirb-version.gem`

Note that this package supports Ruby 1.9. Please ensure that whatever version of ruby puppet is utilizing is the same version of gem used to install the ACIRb gem

Deployment

Given that APIC is a network device, this module is implemented using the `puppet device` framework, meaning that a puppet agent is not run directly on the controller, but rather an intermediary device will proxy between a puppet master and the target device.

You'll need the following components in order to use this module:

- Puppet master
- Proxy device (this can run on the master if needed)
- Configuration manifest
- Device configuration

20

Ansible – a Closer Look

BRKACI-2503

25

21

YAML

- YAML Ain't Markup Language (Yet Another Markup Language)
- Data serialisation language
- Similar use-cases as JSON and XML
- Simple syntax

```
---  
key1: value1  
key1-1: value1-1  
key1-2: value1-2  
  
list:  
- item1  
- item2  
- item3
```

11

22

Tasks

- Execute module (e.g. yum, service) with specified parameters

```
- name: install Apache
  yum:
    name: httpd
    update_cache: true
    state: latest

- name: ensure Apache is running
  service:
    name: httpd
    state: started
```

23

Playbooks

- Map set of hosts and variables to a set of tasks to be executed

```
- hosts: webservers
  vars:
    http_port: 80
    max_clients: 200
  remote_user: root
  tasks:
    - name: ensure apache is at the latest version
      yum: name=httpd state=latest
    - name: write the apache config file
      template: src=/srv/httpd.j2 dest=/etc/httpd.conf
      notify:
        - restart apache
    - name: ensure apache is running (and enable it at boot)
      service: name=httpd state=started enabled=yes
  handlers:
    - name: restart apache
      service: name=httpd state=restarted
```

43

Conclusion

22

44

Conclusion

- Start small – use configuration management to ensure baseline configuration consistency (NTP, Syslog, etc)
- Think about who the user will be (network team, systems team, application team) – they will want different abstractions
- Work in other teams tools (e.g. server teams already using puppet)

45

Getting started

- Use NX-OSv (virtual Nexus 9000)
 - Vmware: ESXi or Fusion
 - KVM
 - VirtualBox
 - http://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus9000/sw/7-x/nx-osv/configuration/guide/b_NX-OSv_9000.html
- Ansible / Puppet demos:
 - <https://github.com/cgascoig/vagrant-nxosv-demos>
- Other examples:
 - <https://github.com/ndelecro/Nexus-9K-Programmability/tree/master/Ansible>
